

Wearable systems for continuous monitoring of physiological parameters

Emiliano Schena

Unit of Measurements and Biomedical Instrumentation
Università Campus Bio-Medico di Roma

Outline

-  Motivation for designing wearable technologies
-  Wearables attributes
-  Use Cases requirements and solutions
-  Future Directions

Wearables are an opportunity

- Population Health
- Digital Biomarkers/ Signs
 - Explain – influence – predict health outcomes
 - Gain fundamental insight into disease origins
- Personalized Health

Standard for health data

Problem Statement

- mHealth data encompasses personal health data collected from sensors and mobile applications
- Mobile health data and metadata standards are needed
 - Each device maker / app developer decides how to represent data and metadata
 - Data are poorly specified
- Standardizing mHealth data and metadata will
 - Make data aggregation across multiple sources easier and more accurate
 - Reduce costs of using mHealth data to make biomedical discoveries, improve health, manage disease

Who should participate:

- Wearable device makers
- Medical device makers
- Health data aggregators
- Health information technology systems managers
- Health information infrastructure providers
- Mobile health app developers
- Biomedical researchers
- Clinicians
- Data scientists
- Government

How to Participate:

If you wish to participate in the IEEE P1752™ Working Group, please go to the website address shown below and scroll to the bottom of the page for instructions.

Targeted biomedical use cases

Remote respiratory monitoring

Breathing abnormalities

Athletes performance evaluation

Accurate cardiac monitoring without electrodes

Adherence to the rehabilitation program

Occupational health and Safety

Emiliano Schena

Unit of Measurements and Biomedical Instrumentation
Università Campus Bio-Medico di Roma

Use Case 1: Remote respiratory monitoring

There is an ever-growing demand for measuring respiratory variables during a variety of applications.

-  **RESPIRATORY RATE**
-  **predictor** of cardiac arrest
-  **prognostic marker** for risk assessment after acute myocardial infarction
-  **early detection** of the risk of the occurrence of dangerous conditions such as ***sleep apnea, respiratory depression*** in post-surgical patients

RESPIRATORY RATE is overlooked and under-recorded

Smart t-shirt proposition

- Form factor → smart t-shirt embedding sensors and electronics
- Sensors → strain sensors at the level of the torso
- Sampling → continuous sampling (at least 30 Hz)
- Real-time → robust/low power communication

Strain Sensors

Conductive
(resistive sensors)

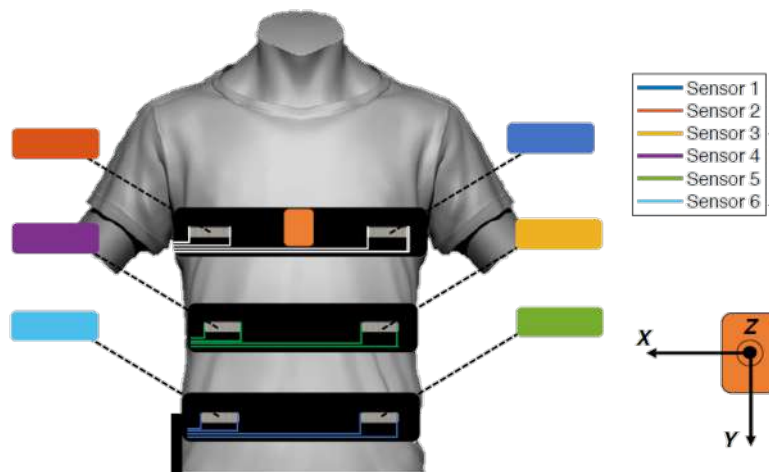

Fiber Optics
(Fiber Bragg Grating)

Use Case 2: Breathing abnormalities

Normal breathing involves synchronized motion of the upper rib cage, lower rib cage, and abdomen.

ABNORMAL BREATHING

-  No optimal use of muscles
-  Desynchronization between upper and lower compartments
-  Musculoskeletal pain
-  Need for respiratory rehabilitation

BREATHING BIOMECHANICS is difficult to assess
with wearables

Università Campus Bio-Medico di Roma

Smart garment proposition

- Form factor → smart t-shirt embedding sensors
- Sensors → Extremely sensitive strain sensors at the level of the torso
- Sensors position → Extremely important
- Sampling → Continuous sampling (at least 30 Hz)
- Real-time → Robust communication

Strain Sensors

Fiber Optics
(Fiber Bragg Grating)

Multi-sensor measurement chain
12 FBGs in 2 fibers

Hemiplegic patients

It has been suggested that hemiplegia caused by a lesion superior to the brain stem will impair diaphragmatic motion.

Unit of Measurements and Biomedical Instrumentation
Università Campus Bio-Medico di Roma

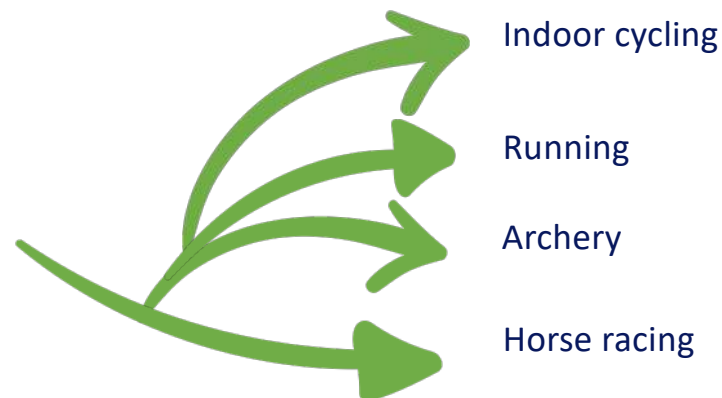

Use Case 3: Athletes performance evaluation

Respiratory rate and heart rate are closely associated with perceived exertion in a variety of exercise conditions. They are strongly associated to the intensity of the sport gestures.

- Abrupt changes in work rate
- Physical and physiological attributes have received limited attention in predicting precision sports performance.

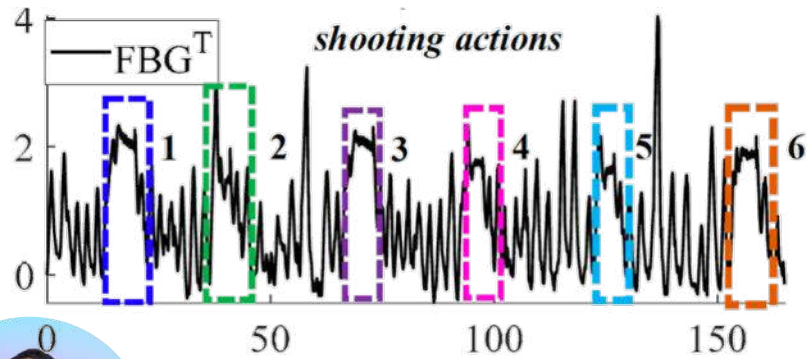

Different sports require dedicated hardware and adaptive algorithms for accurate measurement.

Use Case 4: Continuous cardiac monitoring

"Irregular and often rapid heart rate that can increase your risk of stroke, heart failure, and other heart-related complications... and episodes." [Mayo Clinic]

-  Detection requires heartbeat detection and accurate R-R interval timing
-  Post-diagnosis patients still need continuous monitoring
-  The knowledge of the mechanical heart activity cannot be registered with ECG

HEART-INDUCED CHEST VIBRATIONS
can be used to retrieve cardiac activities.

Emiliano Schena

Fiber optic-based solution

Flexible sensors with 4 FBGs

Pilot trials on healthy volunteers

Emiliano Schena

Unit of Measurements and Biomedical Instrumentation
Università Campus Bio-Medico di Roma

Use Case 5: Adherence to the rehabilitation program

Home rehabilitation, a chimera or a real need to develop physiotherapy?

-  Patients are not monitored continuously during rehabilitation exercises.
-  Rehabilitation treatments at home are not patient-specific
-  The patient is typically not very engaged at home

A multi-sensor platform may enhance the engagement, provide objective measurements and help physician to tailored the treatment.

Use Case 6: Occupational health and Safety

-  Workers are not monitored in occupational settings
-  Physiological and psychological stressors may lead to a loss of productivity and an increase of occupational injuries

A monitoring system of the worker's vital parameters can be fundamental to reduce intervention times in at-risk environments
